

Five studies, two years, three populations

The DisInforMeter went from an initial Lithuanian item pool to a 13-country deployment plus an external-validity confirmation in 16 months. Each chip lists the study code; the N pill carries the sample size; the band above names the study's role.

Five-study chain of evidence behind the DisInforMeter, left → right in time. Each chip lists the study code, sample size, and country. The phase band above the chip names the study's role; the callout below summarises its substantive contribution. N = 10,333.
