

Country-by-country partial-pooled paths from each predictor to FIMI

Bayesian multilevel model: $FIMI \sim 5 \text{ predictors} + \text{random intercept} + \text{slopes by country, pooled S4 metric-invariant factor scores}$. Filled dot = posterior mean; whisker = 95 % CrI; hollow diamond = per-country OLS (the partial-pooling target). Dashed line = EU pooled posterior mean; grey band = pooled 95 % CrI. Red outer ring = country whose OLS estimate falls outside the pooled prediction interval (see diagnostics CSV). Numeric column: posterior mean with ** = 95 % CrI excludes 0, * = 90 % CrI excludes 0.

Country $\times$ predictor paths to FIMI from a Bayesian multilevel regression on pooled metric-invariant factor scores: $FIMI \sim 5 \text{ predictors} + (5 \text{ predictors} | \text{country})$. Filled dot = posterior mean; whisker = 95 % credible interval; hollow diamond = per-country OLS reference (the partial-pooling target). Vertical dashed line = EU pooled posterior mean for that predictor; shaded grey band = pooled 95 % CrI. 30 of 65 country $\times$ predictor cells are credible at 95 % (CrI excludes zero). 9 cells flagged as outside the pooled PI95 (ML estimate suggests the country may not be well-described by the EU pooled prior — see diagnostics CSV). Global max Rhats = 1.007. N = 65.
