

Capability matrix: what each leg of the FIMI evidence chain delivers

EDMO covers what content circulates; the DSA covers how citizens engage with it; the DisInforMeter is proposed to cover why narratives find traction — the receptivity layer the EU does not currently measure in a comparable, longitudinal way.

Leg	Question answered	Unit of analysis	Data source	Status today	What the DisInforMeter adds
Leg 1 EXPOSURE EDMO content monitoring	What FIMI narratives circulate in our information space?	Narrative / item	EDMO national hubs & EEAS StratCom	ESTABLISHED	DisInforMeter shows which narratives find traction in which populations — a demand-side complement to the supply-side catalogue.
Leg 2 BEHAVIOUR DSA platform-data access	How do citizens engage with FIMI content online?	Platform user x content	DSCs / VLOPs under DSA Art. 34 / 35 / 40	OPERATIONAL	DisInforMeter explains why some users engage at all: the population's underlying predisposition to accept FIMI claims.
Leg 3 RECEPTIVITY DisInforMeter (this report)	Why do FIMI narratives land with the populations they do?	General-population sample	EDMO + national statistical offices	PROPOSED (THIS REPORT)	Comparable, longitudinal indicator of population FIMI receptivity — the missing layer the EU does not currently measure.

Capability matrix for the three legs of the FIMI evidence chain. Rows are the three legs (Exposure, Behaviour, Receptivity). Columns compare what each instrument concretely delivers today — the policy question it answers, the unit-of analysis, the data source, its operational status, and the specific gap the DisInforMeter closes or complements. Companion to F-01, which frames the same three legs conceptually.
