

Nomological correlation network (S4 u S5)

DisInforMeter constructs (higher-order, indigo; lower-order, purple) embedded with S4 civic anchors (orange) and S5 validation scales (green). Positive correlations attract; negative correlations repel. Edge colour and width encode sign and strength of Pearson r .

S4 (2025, $N \approx 8,040$) and S5 (2025, $N = 248$). Force-directed layout (stress majorisation + FR relaxation): positive correlations attract; nodes sharing only negative ties drift apart. Edge colour = sign and strength of Pearson r (blue $\rightarrow$ red); edge width/ α = $|r|$. 103 positive, 61 negative edges; threshold $|r| \geq 0.10$, FDR-significant (S4) / $p < .05$ (S5). $N = 164$.
