

Full nomological correlation network (S4 + S5)

All available within-study pairwise correlations are included. Communities are detected from the correlation graph itself, so clusters need not match node type.

Full pairwise S4 + S5 network: all available within-study correlations among DisInforMeter constructs, civic anchors, and validation scales. Layout uses positive ties as attraction and negative ties as repulsion; node fill = type. 813 positive and 295 negative edges. N = 1,108.
